

OVERVIEW OF GEOSYNTHETICS

Dr M K Talukdar, Kusumgar Corporates, Mumbai

What are Geosynthetics

The generic term to all synthetic and natural materials used in geotechnical and man-made applications.

The use of geosynthetics materials has two main objectives:

- to do the job better
- to do it more economically

Why Textiles

- Textiles perform the function :separation, filtration, drainage, reinforcement.
- Textiles are more reliable than soil.
- Textiles can be engineered as per functional requirements.
- Easy for transportation
- Can be laid during inclimate weather.
- Cost effective

Families of Geosynthetics

- Geotextiles
- Geogrids
- Geotubes
- Geonets
- Geomembrane
- Geosynthetic clay liner
- Geofoams
- Geocell
- Geocomposites

Geotextiles

Without Terram

Granular layer

With Terram

Granular layer

Separation component

www.fole2fashion.com

Filtration component

www.fibre2fashion.com

Granular layer

Terram geotextile

Terram allows controlled passage of excess pore water

Soft subgrade

Confinement component

www.film2fashion.com

Granular layer

Terram geotextile

Terram confines lateral movement of granular material

Soft subgrade

(a) LATERAL RESTRAINT

(b) BEARING CAPACITY INCREASE

(c) MEMBRANE TENSION SUPPORT

Figure 5-2 Possible reinforcement functions provided by geosynthetics in roadways: (a) lateral restraint, (b) bearing capacity increase, and (c) membrane tension support (after Haliburton, et al., 1982)

Growth of Geotextiles

Year	Volume, '000 tonnes	Value, US \$ mln
1995	196	565
2000	255	740
2005	319	922
2010	413	1203

Market of geosynthetics in India

Type	Value, Rs cr
Woven geotextiles	85
Nonwoven geotextiles	67
Geogrids and others	35
Geomembrane/Geocomposites(PVDs)	54
Agricultural geotextiles	31
Total	272

Case Study I: Embankment Construction on Soft Soil for National Highway

- Problem:
- Embankment upto 6 m high to be constructed on soft soil.
- 3 km of 6 km road have very soft soil upto 9 m depth.
- Removal and disposal of semi-liquid may pose major environment problem

Sub –soil Condition

- Clay in saturated condition with very low shear strength
- Liquid limit above 100-%
- Plastic limit : 40-42%
- Density: 1.5-1.6 g/cc
- Coeff. of consolidation: 1.0-1.25 m²/year

Solution to Problem

- Install PVDs and stage loading of the embankment fill to accelerate consolidation process.
- Use a suitable geotextile basal reinforcement considered necessary for stability during embankment construction.
- Geotextiles act as a separator between the embankment fill and drainage filter blanket.

Case Study No II on State Highways

Problem:

- Rut depths of 200 -300 mm were observed.
- Every year new road is constructed.
- A non-uniformity in load spreading phenomena occurs.

Load Spreading Phenomenon of Sub-base on Sub Grade

Properties of Soil

- Black cotton soil
- Clay (<0.002mm) ; 62%
- CBR (%)

unsoaked	7.8%
soaked	1.8
- Undrained cohesion : 52.5 kN/m²
- Free Swell (%) 93

Status of Road in Sept, 2003

Status of Road in Sept, 2004

Status of Road in Sept 2005

Case Study III:

Erosion control Measures
For the Bhagirathi river
Prachin Mayapur at Nabadwip in
the district of Nadia,
West Bengal

Photographs of Bhagirathi river Before Geotextile Installation

Photographs of Bhagirathi river Before Geotextile Installation

www.fibre2fashion.com

Solutions to Problem

- Analyzing the site conditions,
- Collection of samples from the sections of river
- Testing of soil samples for its grain size distribution
- Design and recommendations given by Dr S.Y.Mhaiskar of Sardar Patel College of Engineering

Proposed cross section for Erosion Control

Specification of Geotextile recommended

Parameters		KP-70
Mass per unit area (g/m ²)		240
Tensile strength, kN/m (D-4595)	warp	60
	weft	45
% Elongation at break (IS-1969)	warp	37
	weft	22
Grab Tensile strength, (N) (ASTM D-4632)	warp	2000
	weft	1400
Trapezoidal Tearing Strength, N (ASTM D-4533)	warp	800
	weft	500
Water permeability, (D-4491) At 5cm water head	lits/m ² /sec	8
Index Puncture Resistance, (N) (ASTM D-4833)		600
Apparent Opening Size (mm) (D-4751)		≤75 microns

NAIP Project on Rubber Dam

**To Develop Suitable Fabric Substrate
for Flexible Rubber Dams**

www.fibre2fashion.com

www.fibre2fashion.com

www.fibre2fashion.com

RUBBER DAM STRUCTURE

A Rubber Dam consists of four parts

- **A rubberized fabric dam body**
- **A concrete foundation**
- **A control room housing (inflation & deflation mechanisms)**
- **An inlet / outlet piping system**

RUBBERIZED FABRIC DAM BODY

TENTATIVE LAYOUT OF COMPOSITE MATERIAL

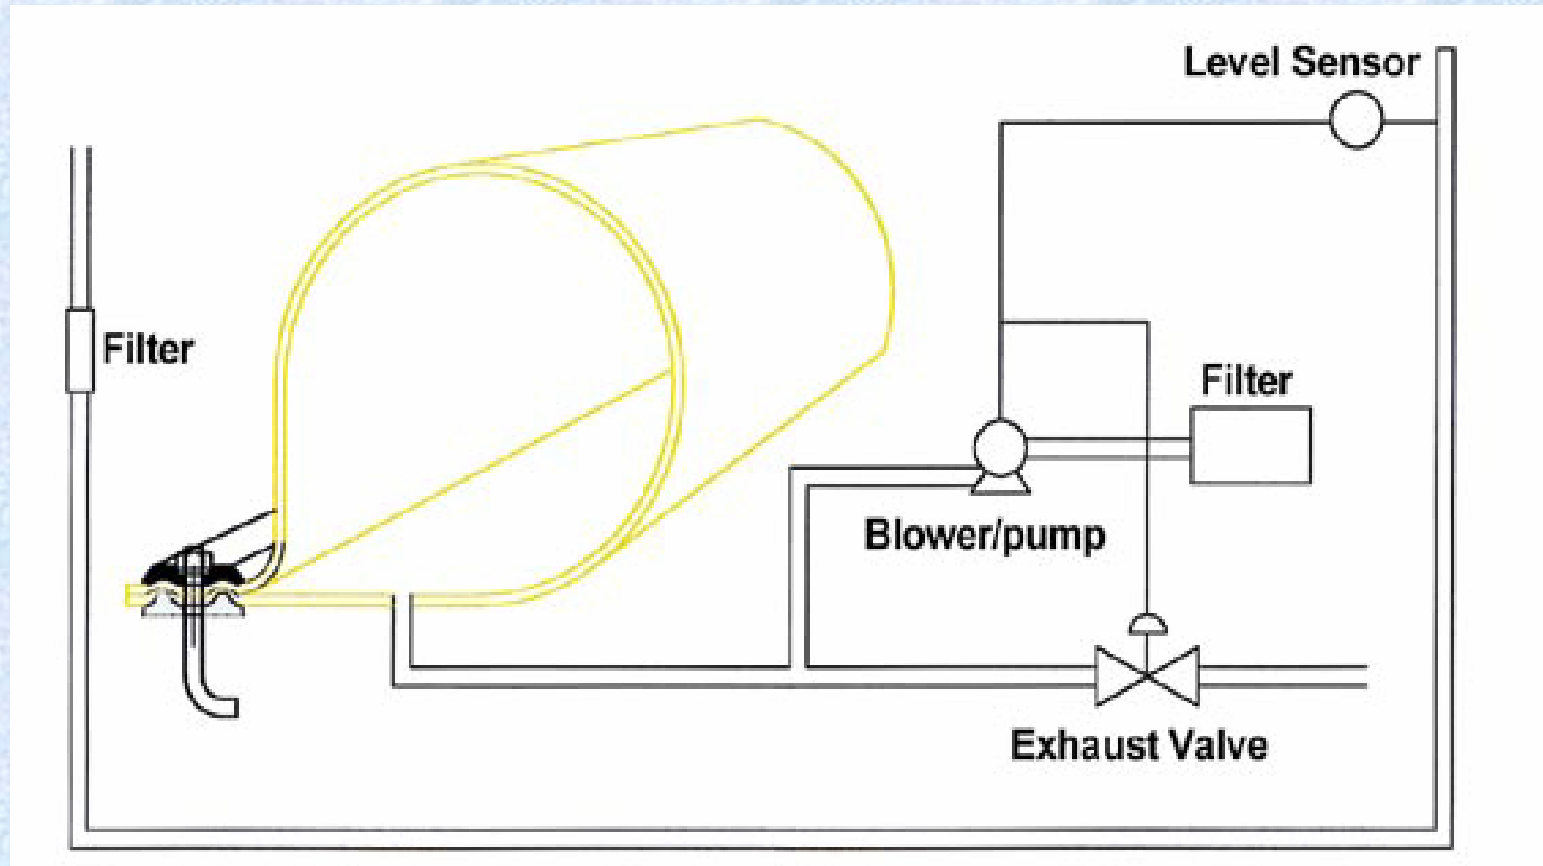

-  Cover compound
-  Friction compound
-  Fabric

CONCRETE FOUNDATION

INFLATION & DEFLATION MECHANISM

ADVANTAGES OF RUBBER DAM

- ➔ **Short construction period**
- ➔ **Easy maintenance and repair**
- ➔ **Long span and adaptable to different slopes**
- ➔ **Low project life cycle cost**
- ➔ **Earthquake resistant**
- ➔ **Adaptable to adverse condition**
- ➔ **Environmental friendly**

Conclusion

- Geosynthetics meet variety of civil engineering functional requirements.
- Their applications are increasing continuously.
- In Indian Scenario, engineers still lack the confidence of using geosynthetics.

THANK YOU
